My Project

Start working on this document in class, finish it at home. Bring it to Week 2, we'll use it to break your project into tasks.

Step 1. The problem & the user

Who is this for? (Be specific)

Pets owners (for now specifically cats owners) who are looking for mats for their pets for breeding.

What problem do they have right now? What do they struggle with?

It is very hard to find a mate for your cat, specially if you are looking for a specific breed, color or in your neighbourhood, many people on social media are asking for money in exchange or are not available in your living area

Why start here: features without a problem are just a wishlist. The problem is what lets you decide later what's actually needed.

Step 2. What does “solved” look like?

If this problem were solved, what could the user now do that they couldn't before?

Have an application that makes it easier to find a mat, either by searching or app recommendations, be able to message the owner, and find a suitable date for meeting up

This is your core. the thing your product must actually achieve.

Step 3. Brainstorm features

List everything you can imagine this product doing. Don't filter yet.

User can predefine criteria for the mat he is looking for, for his cat
Have a geolocation in search
User get recommendation after logging in with new added cats that may match his criteria
Make it available for all kinds of pets not only cats
Add features for hosting the pets by other neighbours during travel times
Add feature for recommending vets, pet's shop in the neighborhood

A feature is one specific thing your product does for the user (e.g. "add an expense", "see a monthly summary"). Get them all out first, then cut.

Step 4. Prioritise (this defines your MVP)

Sort your features into three groups:

- **Must have:** without it, the product doesn't solve the core problem at all
- **Should have:** important, but the core still works without it
- **Nice to have:** improvements, not core

Must have	Should have	Nice to have
Creat Profile for a pet	Set matching criteria	Allow other kinds of pets
Search for nearby matches	Add geolocation In search	Allow hosting pets
	Get recommendations for new matches	Get recommendsations for vets, and other facilities in neighbourhood
		Have a whole community for pets lovers

Your MVP = the "must haves" only. Everything else is your backlog for later.

Step 5. Your MVP in one sentence

"The smallest version that actually solves [the problem] is …"

Creating a pet profile, Searching for matching, chating with owner

MVP = Minimum Viable Product. Minimum (as small as possible) + Viable (it really works, not a useless stub). It's your first working version, you'll improve it from there.

Step 6. One open question

What's one thing you're still unsure about with your idea?

Ensuring the user's safety while chating or exchanging infos with others

It's completely fine if your idea isn't fully settled yet — Week 2 will help you refine it.

Step 7. After group feedback *(fill in after the group exercise)*

What did you change about your idea after your group's feedback?
